Discover the epitome of style and security with H&Y Furniture Manufacturer's range of Laminated flush & External security wooden doors

At H&Y Furniture Manufacturer, we take pride in our innovative modular production process that sets the foundation for our range of stylish and secure flush and security doors. With a commitment to excellence, every step of our manufacturing journey ensures top-notch quality and the perfect fusion of style and security.

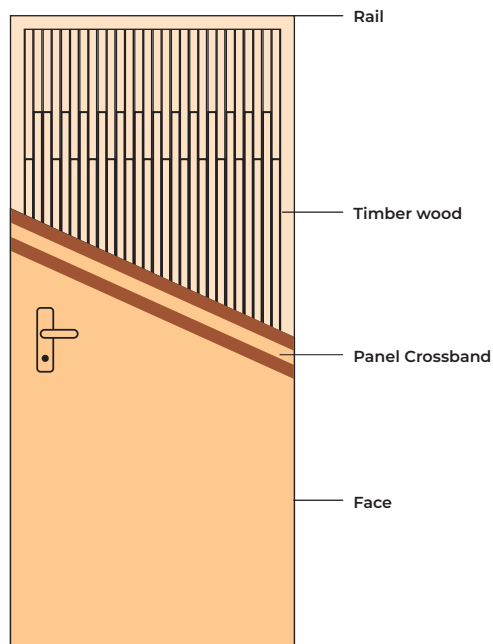

Our flush doors are born from a cutting-edge modular production process, where precision and efficiency reign supreme. By employing state-of-the-art technology and skilled craftsmanship, we create door components with unparalleled accuracy, allowing for seamless assembly and consistency in every piece.

stylish & **secure**

DISCOVER TIMELESS INNOVATION

SOLID CORE OR LAMINATED CORE FLUSH DOORS

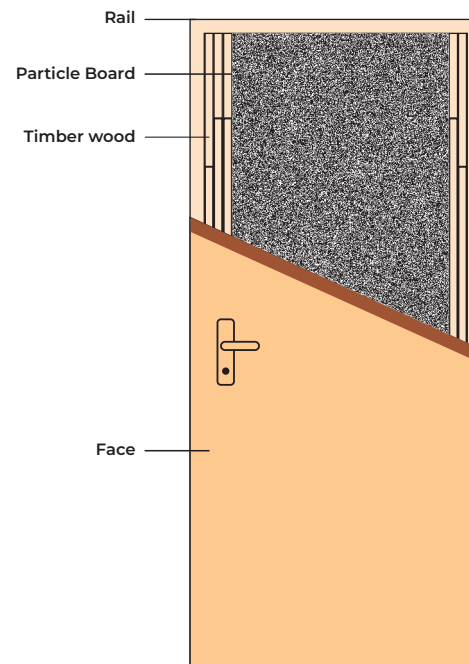

At H&Y, our SOLID CORE doors are solid through and through. They are typically constructed with high-density fiberboard (HDF) or medium-density fiberboard (MDF) which provide a consistent, uniform core. These doors are durable and have better sound insulation than hollow-core doors. They're also more resistant to warping or bowing.

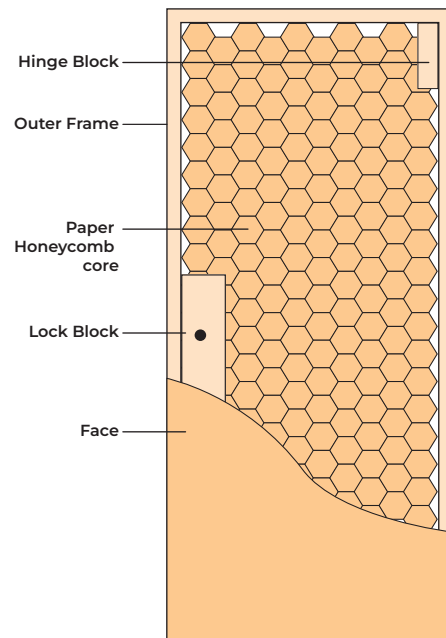

Laminated Core Flush Doors use a core made from several layers of material (such as MDF, HDF, particleboard, or plywood) that are laminated together under high pressure. The core is then covered (or "flushed") with a veneer of wood, plastic, or another material. This construction technique results in a stable, durable door that is resistant to warping and cracking.

SEMI-SOLID CORE

Semi-solid core doors are a combination of solid and hollow-core doors. They contain a solid core, usually MDF or HDF, surrounded by a lightweight material such as cardboard or foam. The combination provides a door that is lighter than a solid-core door but still offers a degree of insulation and durability.

HONEYCOMB FLUSH DOORS

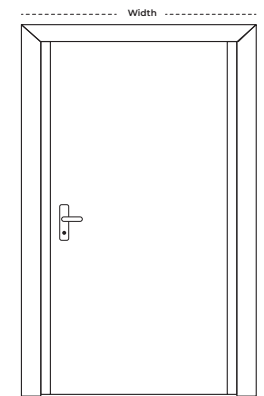

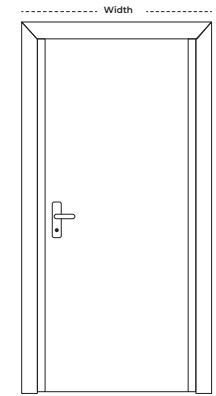

Our hollow core door comprises a framed door in filled with structural paper formed into a honeycomb pattern to provide support and rigidity which is glued in place between the door skin. The inner space of door consists of equally space battens of width 25mm each. Other space is called void space which does not exceed 40% of the area of door.

Here also face veneer and cross-bands are glued under high pressure.
